

## REFRACTION IN CONVEX AND CONCAVE SPHERES

**Fig. 1: Refraction in a convex lens**

A *convex lens* (plus lens) is like two prisms placed base to base. Light passing through a convex lens is converged. Convex lenses are used to treat presbyopia, hypermetropia and aphakia. If parallel light is brought to a focus at 1 metre the lens is said to have 1 dioptriof power. If the focus is at 1/2 metre, 2 dioptries, and at 1/3 metre, 3 dioptries (Fig. 1).

**Fig. 2: Refraction in a concave lens**

A *concave lens* (minus lens) is like two prisms placed apex to apex. Light passing through a concave lens is diverged. Concave lenses are used to treat myopia (Fig. 2).

## REFRACTION OF THE EYE

**Fig. 3: Refraction of the eye**

Light entering the eye is converged at the cornea and then the lens acts as a focusing mechanism to converge the light to a point on the retina, so that the object is seen clearly (Fig. 3).

**Fig. 4: Refraction of the eye when the object is close: accommodation**

If the object is close to the eye then the lens changes shape so that the light rays can still be focused on the retina. This is called accommodation. (The ability to accommodate begins to fail after the age of 40, so that spectacles are need for close work). (Fig. 4).

**Fig. 5: Refraction in the eye: myopia**

In myopia light rays are focused in front of the retina, so that a *minus* concave lens is needed to diverge the rays (Fig. 5).

**Fig. 6: Refraction in the eye: hypermetropia (hyperopia)**

In hypermetropia, it is the opposite, the rays are focused behind the retina so that a *plus* convex lens is needed (Fig. 6).

## REFRACTION IN CYLINDERS

A cylindrical lens has different powers in the vertical and horizontal axes. Thus, light passing through a cylindrical lens does not focus at one point, but forms two foci, one for the horizontal and the other for the vertical. Cylindrical lenses may be convex, concave or mixed. They are used to treat astigmatism.

Published by the International Centre for Eye Health.

(Also available in French)

Available from:

International Resource Centre, ICEH  
11-43 Bath St., London, EC1V 9EL

Price: £5/\$9

Postage and Packing:

Overseas: add £3/\$5 (surface)

or £5/\$9 (airmail) for each item

UK: add £2 for each item

Payment is by bankers' order or cheque (drawn on US\$ or UK£ bank only) made out to **University College London**.

## A Manual of Refraction for Eye Health Workers

Developed by: Mr. Steve Mayer  
Optometrist, CBM International

This excellent Manual of Refraction has 45 pages and includes the following sections:

- basic optics
- pinhole
- accommodation
- neutralisation
- transposition
- best sphere
- crossed cylinder
- cycloplegia
- optical lenses
- visual acuity
- refractive errors
- presbyopia
- focimetry
- spherical equivalent
- retinoscopy
- refraction
- basic spectacle dispensing.

Price : £5/US\$9 + post and packing

**Post and Packing:** Please add £5/\$9 (surface) or £9/\$16 (air)

Payment is by bankers' order or cheque (drawn on US\$ or UK£ bank only) made out to **University College London**.

Please send your order with payment to:  
**International Resource Centre, ICEH  
Institute of Ophthalmology,  
11-43 Bath St., London EC1V 9EL, UK**

## Community Eye Health Courses 2000/2001

- ◆ MSc in Community Eye Health – 1 year (Sept. 2000 – Sept. 2001)
- ◆ Diploma in Community Eye Health – 6 months (Sept. 2000 – Mar. 2001)
- ◆ Certificate in Community Eye Health – 3 months (Sept. – Dec. 2000)
- ◆ Certificate in Planning for Eye Care – 3 months (Jan. – Mar. 2001)
- ◆ Short courses – 1-4 weeks (on-going)
- ◆ Intensive one week course: Planning Eye Programmes (26-30 June 2000)

**Enquiries:** Courses Promotions Officer, International Centre for Eye Health,  
11-43 Bath Street, LONDON, EC1V 9EL, United Kingdom.
